

TRENDS IN THE PERIODIC TABLE

ATOMIC RADIUS

- A measure of the size of an element's atoms
- The mean distance from the nucleus to the boundary of the surrounding cloud of electrons
- Range from 30 -300 pm (picometers)

Atomic Radius Trend:

Increases down a group :

because atoms get bigger as electrons are placed in higher energy levels

Decreases from left to right across
a period

Because each time an electron is added a proton is added as well

The increase in positive charge in the nucleus pulls the electron closer

INCREASING ATOMIC RADIUS

INCREASING ATOMIC RADIUS

Ionization Energy

The energy required to remove an electron from the atom

Units: kilojoules per mole kJ/mol

Ionization Energy Trend:

Decreases down a group:

Electrons removed from higher energy levels are farther from and less strongly bonded to the nucleus

*shielding effect

Increases from left to right across
a period

As more protons are added, the nuclear charge increases and electrons in the same energy level are more strongly attracted to nucleus

INCREASING IONIZATION ENERGY

INCREASING IONIZATION ENERGY

Group 1 Metals:

- have the lowest first ionization energy
- Lose electrons most easily, thus high reactivity

Noble Gases:

- Have the highest first ionization energies
- Do not lose electrons easily, thus very stable

Electron Affinity

- The energy change that occurs when an electron is acquired by a neutral atom
- Causes most atoms to release energy, represented by a negative value
- Units: kilojoules/mole

**** The more negative the value,
the easier it is to add an electron
to a particular atom!**

Generally:

**More negative across a period
from left to right**

**More negative as you move up a
period from bottom to top**

Special Cases: Hard to add an electron

1. Noble Gases: Unfavorable for e^- to reside in a higher shell, so value of 0 or greater
2. 2A Alkali Earth metals: unfavorable to reside in p subshell, value 0
3. 5A Nitrogen group: unfavorable to pair up in p subshell, value closer to 0

Ionic Radii

- Radii of Ions
- Cation – positive ion. Leads to a decrease in atomic radius, as the decrease in e^- results in a smaller electron cloud

Anion- negative ion. Leads to an increase in atomic radius , as the addition of an e- results in the spreading out of the electron cloud

Electronegativity

- A measure of the ability of an atom in a chemical compound to attract electrons
- Valence electrons hold atoms together in a chemical compound
- Often the negative charge of valence e^- is concentrated closer to one atom

Trend:

Increase across a period from left to right

Increase up a group from bottom to top

Alkali and Alkaline Earth Metals: the least electronegative, atoms have a low attraction for electrons

N , O groups & Halogens : the most electronegative , atoms attract electrons strongly in compound
